List of Figures vii
List of Tables viii
Acknowledgments ix

Part I
Introduction
1 Background: the intellectual context 3
2 Getting to the explanation of speech 29

Part II
Speech and its origin: the frame/content theory
3 The nature of modern hominid speech 65
4 Speech in deep time: how speech got started 88

Part III
The relation between ontogeny and phylogeny
5 Ontogeny and phylogeny 1: the frame stage 105
6 Ontogeny and phylogeny 2: the frame/content stage 121
7 The origin of words: how frame-stage patterns acquired meanings 135

Part IV
Brain organization and the evolution of speech
8 Evolution of brain organization for speech: background 163
9 A dual brain system for the frame/content mode 184
10 Evolution of cerebral hemispheric specialization for speech 200

Part V
The frame/content theory and generative linguistics
11 Generative phonology and the origin of speech 223
12 Generative phonology and the acquisition of speech 243
Part VI
A perspective on speech from manual evolution

13 An amodal phonology? Implications of the existence of sign language 273

Part VII
Last things

14 Ultimate causes of speech: genes and memes 293
15 Conclusions 320

Figures

Fig. 1.1  Chomsky's Universal Grammar and its relation to other aspects of language  26
Fig. 2.1  Comparison of the generative and the Neodarwinian view of the relation between nature and nurture for language  47
Fig. 3.1  Schematic view of the three subsystems of speech: respiratory, phonatory, and articulatory  66
Fig. 3.2  The principal parts of the articulatory system  69
Fig. 3.3  Jackendoff's characterization of the segmental structure of the word "star"  74
Fig. 3.4  Formant frequencies for 8 American vowels  78
Fig. 3.5  Schematic view of aspects of speech in the word "tomato"  79
Fig. 3.6  Linguistic structure of the syllable  80
Fig. 5.1  Schematic view of the articulatory component of speech  111
Fig. 7.1  Schematic views of the configuration of the soft palate for nasal and oral sounds  151
Fig. 8.1  Schematic left-lateral view of the brain  164
Fig. 8.2  Schematic left-lateral view of the cerebral cortex  166
Fig. 8.3  Wise's conception of cortical regions involved in motor control in the monkey  169
Fig. 9.1  Schematic view of the cortical organization of speech production  196
Fig. 11.1  Venn diagram showing Anderson's view of the relation between phonology and other subdisciplines concerned with speech  229
Fig. 12.1  Three conceptualizations of the development of the labial–coronal sequence effect  251
Fig. 12.2  Two alternative descriptions of infants' simplified versions of adult words  260
Fig. 13.1  Distribution of spoken babbling onset times in 51 infants  279
Fig. 14.1  Illustrations of birdsongs  300
Fig. 14.2  Cypriot stone figure, thought to be of Aphrodite, 3rd millennium BC  315
Tables

Table 3.1 Phonetic symbols for English consonants and words in which they occur  70
Table 3.2 Phonetic symbols for English vowels and words in which they occur  73
Table 3.3 Occurrence of major consonant types in 317-language sample  75
Table 3.4 Occurrence of vowels in particular locations in the vowel space  76
Table 3.5 Percentage of times that particular sounds occurred in the Maddieson (1994) corpus  77
Table 5.1 Mean observed-to-expected ratios of CV sequences in six English babbling infants  112
Table 6.1 Mean observed-to-expected ratios of VC sequences in first words of ten English-speaking infants  124
Table 7.1 The relation between observed and expected frequencies for consonant–vowel relationships in CVCV forms from Ferguson’s corpus of baby talk terms  140
Table 7.2 Observed-to-expected ratios of CV sequences in Murdock’s 1959 study of parental terms of 474 languages  142
Table 7.3 Observed to expected co-occurrence patterns in CV sequences and VC sequences in Paine’s sample of parental terms in 211 languages  143
Table 7.4 Examples of “defective” word forms  156
